Listing of Claims:

Claims 1-29 (Canceled)

30. (Currently amended) A dynamically configurable retroreflector comprising:
first and second flat mirrors, fixed at a particular included angle with respect to
one another, said first and second flat mirrors defining an intersection axis;

 a third flat mirror mounted for rotation about a rotation axis parallel to said
intersection axis; and

 an actuator coupled to said third flat mirror configured to provide first and second
angular positions about said rotation axis, said first angular position being such to define an
included angle of approximately 90° between said first and third flat mirrors, said second angular
position being such to define an included angle of approximately 90° between said second and
third flat mirrors.

31. (Currently amended) A configurable retroreflector array comprising:
 a support element having first and second mounting surfaces lying in planes
defining an angle therebetween of approximately 90°. 90°;

 first and second MEMS micromirror arrays disposed on respective first and
second substrates, mounted to said first and second mounting surfaces of said support element;

 a given micromirror in said first array being associated with a plurality of M
micromirrors in said second array; and

 an actuator coupled to each given micromirror in said first array to provide M
discrete orientations of said given micromirror, each orientation directing light along an incident
direction toward a different micromirror in said second array;

 said plurality of M micromirrors in said second array having respective
orientations such that each respective orientation is substantially 90° to the orientation of the

given mirror in said first array when the given mirror is oriented to direct light to that micromirror in said second array.

32. (Original) The configurable retroreflector array of claim 31 wherein:
said support element is a V-block having support surfaces facing toward each other; and

said first and second arrays are mounted with said first and second substrates disposed between the micromirrors in the arrays and said first and second mounting surfaces.

33. (Currently amended) A The configurable retroreflector array of claim 31 wherein: comprising:

a support element having first and second mounting surfaces lying in planes defining an angle therebetween of approximately 90° wherein said support element is a prism having support surfaces facing away from each other; and

first and second MEMS micromirror arrays disposed on respective first and second substrates, mounted to said first and second mounting surfaces of said support element wherein said first and second arrays are mounted with the micromirrors in the arrays disposed between said first and second substrates and said first and second mounting surfaces;

a given micromirror in said first array being associated with a plurality of M micromirrors in said second array; and

an actuator coupled to each given micromirror in said first array to provide M discrete orientations of said given micromirror, each orientation directing light along an incident direction toward a different micromirror in said second array;

said plurality of M micromirrors in said second array having respective orientations such that each respective orientation is substantially 90° to the orientation of the given mirror in said first array when the given mirror is oriented to direct light to that micromirror in said second array.-surfaces.

34. (Original) The configurable retroreflector array of claim 31 wherein the micromirrors are limited to deflections on the order of ±10°.

Claims 35-37 (Canceled).

38. (New) A dynamically configurable retroreflector configured to accept a beam incident along an incident path and provide a reflected beam traveling in the opposite direction along a desired one of first and second parallel paths that are 180° to the incident path, the retroreflector comprising:

first and second flat mirrors, fixed at a particular included angle with respect to one another, said first and second flat mirrors defining an intersection axis; and

a third flat mirror mounted for rotation about a rotation axis parallel to said intersection axis, said third flat mirror being rotatable between first and second angular positions about said rotation axis wherein

said first angular position defines an included angle of approximately 90° between said first and third flat mirrors so that the incident beam is reflected off the third flat mirror and the first flat mirror to emerge along the first parallel path that is 180° to the incident path, and

said second angular position defines an included angle of approximately 90° between said second and third flat mirrors so that the incident beam is reflected off the third flat mirror and the second flat mirror to emerge along the second parallel path that is 180° to the incident path.

39. (New) A method of selectively reflecting an incident beam of light that is traveling along an incident path to a desired one of first and second parallel paths that are 180° to the incident path, the method comprising:

disposing first and second flat mirrors with a particular included angle between one another, said first and second flat mirrors defining an intersection axis;

disposing, in the incident path, a third flat mirror that rotatable about a rotation axis that is parallel to said intersection axis; and

orienting said third flat mirror at a desired one of first and second angular positions about said rotation axis, wherein

said first angular position defines an included angle of approximately 90° between said first and third flat mirrors so that the incident beam is reflected off the third flat mirror and the first flat mirror to emerge along the first parallel path that is 180° to the incident path, and

 said second angular position defines an included angle of approximately 90° between said second and third flat mirrors so that the incident beam is reflected off the third flat mirror and the second flat mirror to emerge along the second parallel path that is 180° to the incident path.
